

## The Calendar Year

When all the above conditions are taken into account we can calculate the events that take place during the Martian Calendar year. The results when the vernal equinox occurs at midnight commencing 1 March are tabulated below.

Table 1 - Events of the Martian Calendar Year

| Event | Symbol | $L_{S},{ }^{\circ}$ | $t$, sols | Calend | ar Date |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Sagittarius, Northern Vernal, Southern Autumnal Equinox | 入 | 0 | 0 | Mar | 1.00 |
| Capricorn | yo | 30 | 61.17 | Apr | 6.17 |
| Aquarius | m | 60 | 126.58 | May | 14.58 |
| Aphelion | A | 70.98 | 151.04 | May | 40.04 |
| Pisces, Northern Summer, Southern Winter Solstice | H | 90 | 193.29 | Jun | 26.29 |
| Aries | $\gamma$ | 120 | 257.79 | Jul | 34.79 |
| Taurus | ¢ | 150 | 317.54 | Aug | 38.54 |
| Latus Rectum, Inbound | Q2 | 160.98 | 338.04 | Sep | 3.04 |
| Gemini, Northern Autumnal, Southern Vernal Equinox | II | 180 | 371.86 | Sep | 36.86 |
| Cancer | $\sigma$ | 210 | 421.60 | Oct | 30.60 |
| Leo | $\delta$ | 240 | 468.48 | Nov | 21.48 |
| Perihelion | $\Pi$ | 250.98 | 485.34 | Nov | 38.34 |
| Virgo, Northern Winter, Southern Summer Solstice | mb | 270 | 514.59 | Dec | 11.59 |
| $0^{0}$ Ecliptic Longitude | L0 | 274.94 | 522.26 | Dec | 19.26 |
| Libra | $\Omega$ | 300 | 562.04 | Jan | 3.04 |
| Scorpius | $m$ | 330 | 612.86 | Jan | 53.86 |
| Latus Rectum, Outbound | Q1 | 340.98 | 632.64 | Feb | 17.64 |

## Notes:

Dust storm season: Cancer through Virgo, October 30 - January $1^{1}$
$L_{\mathrm{S}}$ - Planetocentric Longitude of the Sun from the Northern Vernal Equinox
$t$ - Days (sols) since Vernal Equinox
The careful reader will notice that the lengths of the seasons in the table differ slightly from those given before. This is because the table was calculated from a nominal mean orbit, and the parameters differ slightly from those used before. The difference, however, is small, less than 0.05 sol (about an hour).

[^0]The Calendar Date for an event in Table 1 is nominal. It represents the earliest possible time within a 22year cycle of intercalation. To find an approximate time, we must add an offset, as from the following table:

Table 2 - The 22-Year Intercalation Cycle

| Year in <br> Cycle | Offset | Days <br> in Year | Days <br> in Feb | Year in <br> Cycle | Offset | Days <br> in Year | Days <br> in Feb |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | 0.01 | 668 | 52 | 12 | 0.51 | 669 | 53 |
| 2 | 0.60 | 669 | 53 | 13 | 0.10 | 668 | 52 |
| 3 | 0.19 | 668 | 52 | 14 | 0.69 | 669 | 53 |
| 4 | 0.78 | 669 | 53 | 15 | 0.28 | 668 | 52 |
| 5 | 0.37 | 668 | 52 | 16 | 0.87 | 669 | 53 |
| 6 | 0.96 | 669 | 53 | 17 | 0.46 | 669 | 53 |
| 7 | 0.56 | 669 | 53 | 18 | 0.06 | 668 | 52 |
| 8 | 0.15 | 668 | 52 | 19 | 0.65 | 669 | 53 |
| 9 | 0.74 | 669 | 53 | 20 | 0.24 | 668 | 52 |
| 10 | 0.33 | 668 | 52 | 21 | 0.83 | 669 | 53 |
| 11 | 0.92 | 668 | 52 | 22 | 0.42 | 669 | 53 |
|  |  |  |  |  |  |  |  |
|  |  |  |  |  |  |  |  |

To find the time of an event in a given year of the 22-year cycle, add the offset to the calendar date. Thus, for example, if we want the approximate time of the Perihelion in the $10^{\text {th }}$ year of the cycle, we add the offset of the year 10 in the table above, 0.33 , to the nominal calendar date, November 37.24 to get November 37.57, or approximately $1: 40 \mathrm{pm}$ at Airy-0 on November 37. The times are no more precise than about 10 or 15 minutes.

The offset may place an event on the following date. For example, we wish to find the time of the northern summer solstice in the $16^{\text {th }}$ year of the cycle, we add 0.86 to June 25.29 to obtain June 26.15, or about 1:40 am at Airy-0 on June 26. We notice that this puts the solstice on a different date than the nominal June 25. The northern vernal equinox, however, falls within March 1.

| 4 | 12 | 20 | 28 | 36 | 44 | 52 | 60 | 68 | 76 | 84 | 92 |
| 5 | 13 | 21 | 29 | 37 | 45 | 53 | 61 | 69 | 77 | 85 | 93 |
| 6 | 14 | 22 | 30 | 38 | 46 | 54 | 62 | 70 | 78 | 86 | 94 |
| 7 | 15 | 23 | 31 | 39 | 47 | 55 | 63 | 71 | 79 | 87 | 95 |
| 8 | 16 | 24 | 32 | 40 | 48 | 56 | 64 | 72 | 80 | 88 | 96 |

## Notes:

February ends on the $52^{\text {nd }}$ or $53^{\text {rd }}$ as needed by the 22-year intercalation cycle.
The Dominical Letter can be computed as: $L=7-\bmod ((\operatorname{int}(79(\mathrm{MY}+14) / 22)+6)$, 7$)$, where $1=\mathrm{A}, 2=$ $\mathrm{b}, 3=\mathrm{c}$, etc. To avoid unwieldy numbers, we may subtract multiples of $154(=7 \times 22)$ from MY without changing the result. Such multiples are: 1540, 2310, 3080, 3234, 3388, 3542, 3696, and 3850.

* Golden Letter for the day of the month.
$\dagger$ The week begins on Sunday
